

Simplify Policy Consolidation on Premises and Streamline Your Migration to Intune

Cleaning up, consolidating, and reorganizing a legacy Group Policy environment manually is time-consuming and error-prone. GPO Migrator simplifies this process by allowing IT teams to pick individual settings from existing GPOs and move them with precision to new GPOs or Microsoft Intune profiles. By integrating with [GP Reporting Pak](#), you can first analyze your environment for duplicates and conflicts, then use those insights to create optimized, consolidated policies. Eliminate the risk of «lift-and-shift» migrations and ensure only compatible, necessary settings reach your endpoints.

Benefits

- **Eliminated complexity:** Use granular selection to pick only the settings you need from various sources, consolidating multiple redundant GPOs into a single, optimized policy.
- **Low-risk transition to the cloud:** Avoid business disruption by validating Intune compatibility before you migrate, ensuring that only supported settings are moved.
- **Accelerated policy delivery:** Automate domain migrations and reorganization projects by moving settings between environments with a few clicks instead of manual re-entry.

Features

Granular migration: Select specific policy areas (Administrative Templates, Security Settings, etc.) or individual settings from GPOs, GP Reporting Pak snapshots, or RSOP.

Intune compatibility checker: Gain immediate visibility into which Group Policy settings are supported by Intune before the migration begins to prevent configuration gaps.

GP Reporting Pak Integration: Leverage Reporting Pak snapshots as a migration source to merge settings from different GPOs.

Installation Requirements

Operating systems: Microsoft Windows 11 and Microsoft Windows Server 2016 - Windows Server 2025

Memory: Minimum 100MB free RAM

Hard Disk: Minimum 50MB free disk space

Additional Requirements: Microsoft .NET Framework 4.7.2+, Microsoft Group Policy Management Console (GPMC)
